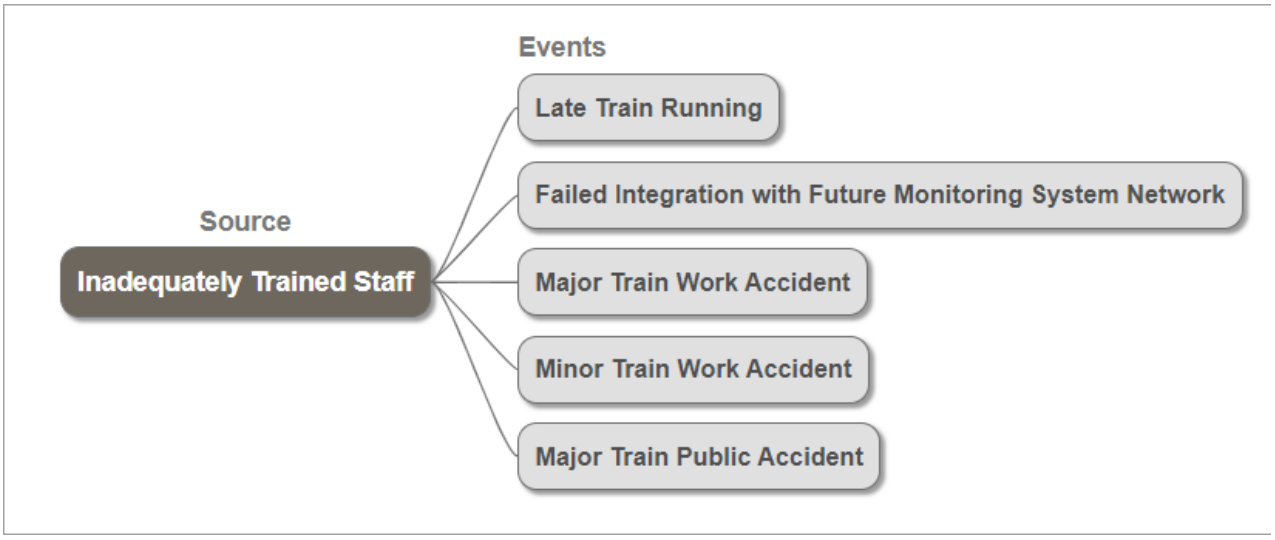
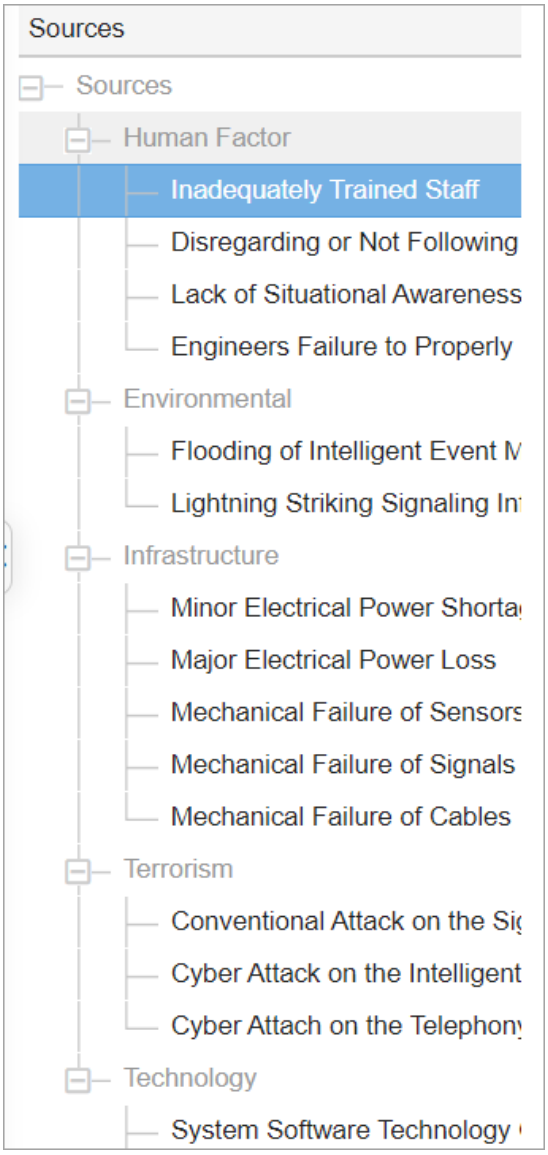
Sources Contribution to Events

The Threats Contribution to Events page allows you to define the contributions (Vulnerabilities Grid) in a mindmap or chart format.



This is similar to Event Vulnerabilities to Threats, but instead of selecting the event, we select the source node and then specify all the events the selected source is contributing to.

You can select a source from the Likelihood Hierarchy:



You can only assign contributions to covering sources, this is why the non-covering nodes are disabled.

You can add a new event by clicking A modal will pop out where you will enter the event names -- one event per line.
